

K-Rip Staples

Fast belt repair fasteners and joiners

K-Rip Staples are ideal for use for fast on line repairs of tears in conveyor belting. When conveyor belt damage occurs it is necessary for a minor rip to be contained immediately before it leads to more significant tear damage.

To maintain production despite any damage, K-Rip Staples are ideal because the repair can quickly be carried out under full belt tension. A hammer is the only tool necessary to carry out this durable repair.

K-Rip Staples should always be fitted across the belt so that they run smooth over the pulleys. The recommended spacing is approximately 125mm apart.

An edge tear which extends in 25% or more across the width of the belt requires permanent fastening or a new vulcanised joint.

K-Rip Staples are packed in pails of 100 units enough to repair a 12 metre rip in all types of conveyor belts up to 20mm thick.
